

N.B. u/g to kernel 5.18.5 (not LTS 5.15)

- ~/XTerm overrides system copy

- paste highlight (and not action) is inputrc (bash bind can override)

- Alt-f, b &c. needs metaSendsEscape. Option in VT100 menu, or put "XTerm.vt100.metaSendsEscape: true" in XTerm.(xterm has vt100 and tek widgets, also menubar if configured).

- Laptop suspended on lid shut

<https://www.linuxquestions.org/questions/slackware-14/how-to-disable-suspend-when-laptop-lid-is-closed-4175692244/>

- PTV map display is a moving target. Firefox never displays maps on the slackware 14.2 system. Firefox running on a system where maps display on the X server local to that system also fails when using the slackware 14.2 system for its display.

The only interesting system is the laptop which is "almost" updated to slackware 15.0. On that system:

xterm running on	xterm DISPLAY	firefox DISPLAY	.mozilla renamed?	Result
smallstar	:0	:0	N	PASS
smallstar	:0	smallstar:0	N	FAIL
smallstar	:0	smallstar:0	Y	PASS
smallstar	smallstar:0	smallstar:0	Y	PASS
smallstar	smallstar:0	smallstar:0	N	PASS
smallstar	smallstar:0	:0	N	PASS

Maps display except in the case where the xterm is using :0 (X unix socket) and firefox is using smallstar:0 (X internet socket). But it does work if I rename .mozilla, to force a fresh profile.

I plan to investigate this further.
